Abstract—Nutrition is a component of body builders in order to maintain and repair the tissues so that the function of the body can function properly. Currently in the village broke promontory has run a program providing nutrition food additive in which the program is based as a growth pattern in the village communities are uneven due to the lack of ancestry in consuming foods that are healthy and nutritious. Until now there has been the way of effective work to determine the acceptance of additional nutrients in the village broke headland. This study aims to assist the village in determining Nutritional Supplement acceptance in the village of Tanjung Disconnect. This system is built using a simple method that perogram Additive weighting that can be done more effectively. Additive simple weighting method is one method used in decision support seistem prosesperhitungnya by finding the weight values for each attribute.

Keywords: Decision Support Systems, Simple Additive weighting, Nutrition

1. Introduction

Nutrition becomes a benchmark for the level of health of the individual or group of people in life. Currently the village has promontory dropping menjalahkan based program for my growth pattern on the people residing in the village is uneven due to lack of family in a healthy diet and nutritious. Until now there has been the way of effective work to determine the acceptance of additional nutrients in the village broke headland. In this study, the authors use a simple additive weighting method (SAW). With this system will speed up the village can choose beneficiary data that are relevant in determining the approach used in the decision making process to evaluate the activities of alternative election for the determination of additional nutrients to masayakat pemberiaan.

2. Theory

A. Decision Support System

According to Turban and Aronson (2011: 75) Decision Support System (DSS) or Decision Support System (DSS) is a system that is intended to support decision-makers managerial decision situations semistructured and structured SPK can be applied in the process of providing solutions in the decision to a problem in conditions of many criteria or Multiple criteria Decision Making (MCDM) in the SPK. The solution provided is shown is a suggestion in the form of ratings.

B. Openness component Decision Support

As for the components of Decision Support Systems are as follows:

a) Data Management, includes a database containing relevant data and governed by a system called Database Management System (DBMS).

b) Management Model, a software package that includes financial models, statistics, management science, or other quantitative models that provide analytical skills and management system related software.

c) The user interface, media interaction between the system with the user, so that users can communicate and give commands on the CMS through this subsystem.

d) Knowledge-based subsystems, subsystems can support other subsystems or act as a stand-alone component.

In order to more clearly understand the conceptual model SPK. (Nofriansyah and defit, 2017: 3)

C. Additive weighting system

Simple Additive weighting can be interpreted as a simple weighting method or weighted summation on solving problems in a decision support system. The concept of this method is to look at the priority scale performance ratings of each alternative called attributes (Nofriansyah, 2017: 33). In this study, the authors use
Simple Additive weighting method (SAW) The steps are as follows:

a) Specifies an alternative, yaitu Ai.

b) Menentukan kriteria yang akan referenced dalam pengambilan decision, yaitu Cj.

c) Memberikan nilai rating kecocokan each alternative padasetiap criteria.

d) Determining the weight of preference or importance level (W) of each criterion.

\[ W = [W_1 \ W_2 \ W_3 \ ... \ W_J] \]

e) Creating tables rating kecocokan of setiap alternatif padasetiap criteria.

f) Melakukan normalisasi matrik keputusan dengan menggunakan nilai rating kinerja ternomalisasi (rij) of alternative padakriteria.

\[
\begin{align*}
X & = \begin{bmatrix}
    r_{11} & r_{12} & \cdots & r_{1j} \\
    \vdots & \vdots & \ddots & \vdots \\
    r_{i1} & r_{i2} & \cdots & r_{ij}
\end{bmatrix}
\end{align*}
\]

g) Melakukan normalisasi matrik keputusan dengan menggunakan nilai rating kinerja ternomalisasi (rij) of alternative padakriteria.

Formula for normalization are: normalization calculation is based on the costs and benefits.

\[
\begin{align*}
R_{ij} &= \frac{X_{ij} \text{ if } j \text{ is an attribute of the advantages (benefits)}}{\text{Max } X_{ij}} \\
R_{ij} &= \frac{X_{ij} \text{ if } j \text{ is an attribute of the cost (cost)}}{\text{Min } X_{ij}}
\end{align*}
\]

Where :

a) Vi = Ranking for each alternative

b) Rij = Normalized performance rating

c) Max xij = Maximum value of each row and column

d) Min xij = Minimum value of each row and column

e) Xij = Rows and columns of a matrix

f) Benefit = jka greatest value is best

g) cost = if the smallest is the best value

Vi larger value indicates that the alternative Ai is selected were:

a) It said the criteria of profit if the value of benefit decision-making, otherwise if the cost criterion raises the cost for decision making.

b) If such criteria profits then divided by the mean value of each column, while the cost criteria of each column divided by the value.

c) Results of rating kinerja ternomalisasi value (rij) form a normalized matrix (R)

\[
\begin{bmatrix}
    r_{11} & r_{12} & \cdots & r_{1j} \\
    \vdots & \vdots & \ddots & \vdots \\
    r_{i1} & r_{i2} & \cdots & r_{ij}
\end{bmatrix}
\]

d) Hasil akhir nilai preferensi (Vi) diperolehdari penjumlahan hirarkial dari preferensi normalized matrix (R) dengan bobot preferensi (W) yang bersesuaian elemen kolom matrix (W). niali preference for each alternative (Vi) is given as:

\[
V_i = \sum_{j=1}^{J} W_j R_{ij}
\]

Preference value for each alternative is obtained by multiplying the result menjumlahan normalized performance rating with weighting each criterion.

Where :

a) Vi = The final value of alternative

b) wj = The weights have been determined

c) Rij = Normalization matrix

D. Understanding Nutrition

Nutrition is defined as the process of using food consumed organisms normally through the process of digestion, absorption, transport, storage, metabolism and expenditure of nutrients to sustain life, growth and normal functioning of the body organs as well as to generate power (irianto, 2006: 2).
In the medical world of nutrition as a component of the human body builder so that it can maintain and repair the tissues of the human body functions itself. The -macam kinds of substances included in nutrition is water, carbohydrates, minerals, vitamins, proteins, lipids or fats.

3. Results and Discussion

A. Problem analysis

Analysis is an activity that starts from the beginning in the study and evaluate a form of the problems found. The system to be constructed cannot be separated from the data recipients to take advantage of additional nutrients and Simple Additive Weigthing (SAW) in the decision-making process. Based on the results of research carried out in the village of Tanjung Break up with potential recipients then use data analysis was conducted on the document input, process analysis, and document output. In the system making the village the candidate receiving the data needed nutritional supplements as a reference to describe the system requirements.

B. Discussion

1) Implementation Methods
a. Determining Alternative
An alternative is the recipient of a qualified determination of additional recipients of nutrition in rural communities Tanjung Disconnect.

b. Determining each each criterion

e. The decision matrix formed from a decision matrix table rating the suitability of any alternative at each criterion

\[
\begin{bmatrix}
X_{ij} \\
\end{bmatrix}
\text{if } j \text{ is an attribute}
\]

\[
\text{Max}_{i}X_{ij} \text{ advantage (benefit)}
\]

\[

t_{ij} = \text{Mini}_{i} X_{ij} \text{ if } j \text{ is an attribute of the cost (cost)}
\]

\[
X_{ij}
\]

f. Doing Normalization Matrix

The next step is Perform normalization matrix to calculate the value normalized performance rating \((rij)\) of the alternative \(A_i\) Reviewed by \(C_j\) attribute equations adjusted for the type attribute.

Formula for normalization are as follows

\[
\begin{align*}
\text{Max}_{i}X_{ij} = & \frac{1.00}{X_{ij}} \\
\text{Min}_{i}X_{ij} = & \frac{0.80}{X_{ij}} \\
\end{align*}
\]

\[
\begin{align*}
\text{Max}_{i}X_{ij} = & \frac{0.80}{X_{ij}} \\
\text{Min}_{i}X_{ij} = & \frac{0.60}{X_{ij}} \\
\end{align*}
\]

\[
\begin{align*}
\text{Max}_{i}X_{ij} = & \frac{1.00}{X_{ij}} \\
\text{Min}_{i}X_{ij} = & \frac{0.60}{X_{ij}} \\
\end{align*}
\]

\[
\begin{align*}
\text{Max}_{i}X_{ij} = & \frac{0.40}{X_{ij}} \\
\text{Min}_{i}X_{ij} = & \frac{0.20}{X_{ij}} \\
\end{align*}
\]

</table>
\[ r_{31} = \frac{0.40}{\max(1.00; 1.00; 0.40; 1.00; 0.40)} = \frac{0.40}{1.00} = 0.4 \]

\[ r_{41} = \frac{1.00}{\max(1.00; 1.00; 0.40; 1.00; 0.40)} = \frac{1.00}{0.40} = 1 \]

\[ r_{51} = \frac{1.00}{\max(1.00; 1.00; 0.40; 1.00; 0.40)} = \frac{1.00}{0.40} = 0.4 \]

\[ r_{12} = \frac{\min 0.80; 0.80; 0.60; 1.00; 0.40}{0.80} = \frac{0.40}{0.80} = 0.5 \]

\[ r_{22} = \frac{\min 0.80; 0.80; 0.60; 1.00; 0.40}{0.80} = \frac{0.40}{0.80} = 0.5 \]

\[ r_{32} = \frac{0.60}{\min 0.80; 0.80; 0.60; 1.00; 0.40} = \frac{0.60}{1.00} = 0.67 \]

\[ r_{42} = \frac{1.00}{\min 0.80; 0.80; 0.60; 1.00; 0.40} = \frac{1.00}{0.40} = 0.4 \]

\[ r_{52} = \frac{0.40}{\min 0.80; 0.80; 0.60; 1.00; 0.40} = \frac{0.40}{0.40} = 1 \]

\[ r_{13} = \frac{0.80}{\max(0.80; 0.40; 0.60; 0.80; 1.00)} = \frac{0.80}{0.80} = 0.8 \]

\[ r_{23} = \frac{0.40}{\max(0.80; 0.40; 0.60; 0.80; 1.00)} = \frac{0.40}{0.60} = 0.4 \]

\[ r_{33} = \frac{0.60}{\max 0.80; 0.40; 0.60; 0.80; 1.00} = \frac{0.60}{1.00} = 0.6 \]

\[ r_{43} = \frac{0.80}{\max 0.80; 0.40; 0.60; 0.80; 1.00} = \frac{0.80}{1.00} = 0.8 \]

\[ r_{53} = \frac{1.00}{\max 0.80; 0.40; 0.60; 0.80; 1.00} = \frac{1.00}{0.80} = 1 \]

\[ r_{14} = \frac{0.40}{\max(0.40; 0.40; 0.60; 0.60; 0.60)} = \frac{0.40}{0.60} = 0.67 \]

\[ r_{24} = \frac{0.40}{\max(0.40; 0.40; 0.60; 0.60; 0.60)} = \frac{0.40}{0.60} = 0.67 \]

\[ r_{34} = \frac{0.60}{\max(0.40; 0.40; 0.60; 0.60; 0.60)} = \frac{0.60}{0.60} = 1 \]
Determining the value of preferences \( (V_i) \) obtained from the sum of the normalized rows of the matrix multiplication element \( (R) \) with a preference weighting \( (W) \) corresponding element column matrix \( (W) \).

\[
V_i = \frac{\text{max}(0.40; 0.40; 0.60; 0.60)}{0.60} = \frac{0.40}{0.40} = 1
\]

\[
V_2 = \frac{\text{max}(0.40; 0.40; 0.40; 0.20)}{0.40} = \frac{0.40}{0.40} = 1
\]

\[
V_3 = \frac{\text{max}(0.40; 0.40; 0.40; 0.20)}{0.40} = \frac{0.40}{0.40} = 1
\]

\[
V_4 = \frac{\text{max}(0.40; 0.40; 0.40; 0.20)}{0.20} = \frac{0.40}{0.20} = 0.5
\]

\[
1.00 0.50 0.80 0.67 1.00
1.00 0.50 0.40 0.67 1.00
0.40 0.67 0.60 1.00 1.00
1.00 0.40 0.80 1.00 1.00
0.40 1.00 1.00 1.00 0.50
\]

Below is a table ranking the preferences based on the weights of each alternative. The reference in this perangkingan is based on the highest value (max) which made the highest rank.
4. Conclusion

Based on the development that has been done during the process of analysis and design to implementation of decision support system of determining an additional receiver nutrition with Simple Additive weighting method it can be concluded as follows:

1. Decision support systems determine additional recipients and testing of nutritional computerized decision support systems result determination nutritional supplement recipients have used the Simple Additive weighting method.

2. With the implementation of decision support systems with Simple Additive weighting method can be used for the determination of nutrients by inserting an additional receiver in the form of alternative data then enter the weight value is seen on the criteria, so as to generate value calculation and perengkingan recipients name candidates. With the decision support systems with Simple Additive weighting calculation method that can help the country in completing their duties effectively and efficiently.
