Abstract—Motorcycles are the main means of transportation that is widely used to support the activities of their societies. Prior to the development of technology, motorcycles still use carburetors. But motorcycles are still using carburetor system is still quite wasteful. With the development of technology, there is now applying the Yamaha brand motorcycles capable of supplying petrol injection engine needs. Motorcycles injection technology is much more efficient compared to motorcycle carburetor technology, in addition to economical motorcycle of this type has a performance engine and a reliable power. But frequent obstacles that cause damage to the injection Yamaha motorcycle, disrupting users. An expert system is a system that adopts the expertise of an expert an expert in a particular field into the system or a computer program is presented with a display that can be used by a user who is not an expert so that system users can make a decision or set policy like an expert in finishing problem. Certainty factor method used to obtain the value of the certainty of damage from an expert motorcycle injection, so that the user also gets the value of the damage certainty selected symptoms of the experience of experts. The results of diagnostics in expert system that has been made that if the user mencheklis symptoms such as clogged when rotated gas engine, electric distater difficult / lift, lights up when the engine is difficult to use the kick starter, often emit exhaust sound of an explosion, it can be concluded from the analysis that the damage found on the spark plug with a value of MB = 0.99, MD = 0.22 and Certainty Factor value of 76.66%. The diagnosis ever made by a visitor or mechanical accessible again by entering an email to the database.

Keywords: Motorcycles, expert systems, Cetainty Factor.

1. Introduction

In an era of fast-paced, many people started looking for ways that can support their activities. Not hanyasmartphone and laptopsaja, but also the vehicle. Today most of the people prefer motorcycles as the main means of transportation compared to other vehicles such as private cars or public transport, as well as being effective and more efficient, [1] Prior to the development of technology, motorcycles still use carburetors, which is a device that mixes air and fuel for an internal combustion engine. But motorcycles are still using carburetor system is still quite wasteful. With the development of technology, there is now applying the Yamaha brand motorcycles capable of supplying petrol injection engine needs. You do this by spraying the fuel that has been measured: by sensors in it that makes motorcycle injection technology is much more efficient compared to motorcycle carburetor technology, in addition to economical motorcycle of this type has a performance engine and a reliable power. [2] But frequent obstacles that cause damage to the injection Yamaha motorcycle, disrupting users. There are still many users do not know the Yamaha motorcycle constraints Yamaha motorcycle damage to the injection-system. The problem for users of Yamaha motorcycles applying the injection can be fatal if not repaired the damage type. In general, users will tend to leave at a mechanical workshop. The level of mechanical difficulties experienced in knowing or determining the type of damage to the brand Yamaha motorcycle injection has prompted researchers to use information technology through a method that combines the expertise and knowledge of an expert to devise a system to solve the problem. Expert systems try to find a satisfactory solution as did an expert. [3] *certainty Factor* is a measure of certainty to a fact or rule. Certainty Factor provides a draft Measure of Believe (MB) is the belief hypothesis is affected by symptoms and Measure of Disbelieve (MD) is the lack of hypotheses that are affected by the symptoms. This method was chosen because it can display the value of the percentage of confidence in the fact that identified, but it is also this method in a two count only be able to process the data only so that its accuracy is maintained. [4]

2. Theory

2.1 Expert system

An expert system is a system that adopts the expertise of an expert in a particular field into the system or a computer program is presented with a display that can be used by a user who is not an expert. When using the system, the user can make a decision or set policy like an expert in finishing a problem. [5]

a. Expert System Components

Expert systems generally have three elements: knowledge base (Knowledge Base), Inference Engine (Inference Engine), and User Interface (UI). [6]

2.2 certainty Factor

A *certainty factor* (CF) is a clinical parameter value yang diberikan MYCIN to show how much confidence. In the face of a problem often found answers that do not have full certainty. Uncertainty of bias in the form of probability or dependent on the outcome of an event. [7]

a. Advantages and Disadvantages Metode Certainty Factor.

Excess certainty factor method is:

- This method is suitable for use in an expert system that contains uncertainties.
- In one calculation process can only handle 2 data only so that the accuracy of the data can be maintained.

While the lack of certainty factor method is:

- Modeling uncertainty using certainty factor calculation method is usually still debated.
- For more than two pieces of data, should be done several times a data processing. [8]

2.3 Certainty Factor (Certainty Factor)

The basic formula kepastian CF factor $(h, e) = MB(h, e) - MD(h, e)$.

Information :

CF (h, e) : certainty factor of the hypothesis h that are affected by symptoms (evidence) e . CF value ranging from -1 to 1. A value of -1 indicates absolute disbelief while the absolute value of 1 indicates kepercayaan.

MB (h, e) : the size of the increase in confidence (measure of Increased belief) of the hypothesis h that are affected by the symptoms e .

MD (h, e) : the size of the increase in distrust (measure of increased disbelief) of the hypothesis h that are affected by the symptoms e .

h : Hypothesis (between 0 and 1).

e : Events / facts (evidence).

In one case there will be more than one size of the increase in trust in accordance with many of the symptoms that are owned by hypothesis, so the formula MB and MD as follows:

$$MB[h, e_1, e_2] = \frac{0 \cdot MB[h, e_1] + 1 \cdot MB[h, e_2]}{MB[h, e_1] + MB[h, e_2] - (1 \cdot MB[h, e_1]) \cdot (1 \cdot MB[h, e_2])}$$

$$MD[h, e_1, e_2] = \frac{0 \cdot MD[h, e_1] + 1 \cdot MD[h, e_2]}{MD[h, e_1] + MD[h, e_2] - (1 \cdot MD[h, e_1]) \cdot (1 \cdot MD[h, e_2])}$$

3. Research methods

This method describes what methods will be used in the study, it is the method of Certanty Factor. *certainty factor* a calculation degree of certainty to the conclusions obtained were calculated based on the probability. To assist in the preparation of this study, the need for the composition of the framework (Frame Work) is clear in its phases. This framework is the steps that will be done to solve the problem to be discussed. Here is a framework of research:

Fig. 1. Flow Research Stages

4. Analisia And Design

4.1 Data analysis

The data analysis is the effort or how to process data into information so that the characteristics of the data can be understood and useful for solutions to problems will be resolved, especially issues related to research. The success of an expert system lies in how to cultivate the knowledge derived from data processing to be drawn to a conclusion. Data on the knowledge gained from the research conducted on a motorcycle mechanic injection particularly for Yamaha in the garage Yamaha. From the results of research that has been done, the data obtained from Yamaha motorcycle shop such as the following:

Table 1.
symptom

Code	symptom
KG01	Engine faltered when played gases.
KG02	Distater electrically difficult / not raised.
KG03	Engineering difficult light up when using the kick starter.
KG04	The road feels stilted.
KG05	Often emit exhaust sound of an explosion.
KG06	Total dead engine.
KG07	Wasteful fuel consumption.
KG08	In the state of the roads was accompanied popping sounds of screeching skid.
KG09	A voice came from inside the box CVT friction when the road.
KG10	When the engine suddenly died.
KG11	Roads clogged when speeds above 50 km.
KG12	Crackling sound when the road inside the box CVT.
KG13	The machine is turned difficult.
KG14	Less than the maximum traction motors.
KG15	When the handle is opened happen buffeting gas coarse / motorcycle jumping.
KG16	Sound rough when the road slowly.
KG17	A decrease in engine performance.
KG18	Exit pungent smell of smoke from the exhaust.
KG19	When exit mengebul dense smoke.
KG20	Acceleration lap top as restrained.
KG21	Engine running at idle is not stable.
KG22	Exit thick white smoke from the exhaust.
KG23	There was the sound of scraping on the machine.
KG24	The engine is very hot.
KG25	Rough engine sound.
KG26	Engine oil quickly reduced.
KG27	Engine oil seeps.

4.2 Case study

A motorcycle owners want to know the damage that occurs in its motorcycle injection. Motorcycle experience symptoms such as The road feels sluggish at best, wasteful fuel consumption, When the engine suddenly died, turned hard Machines, currently unstable engine running idle, engine oil quickly reduced. Here is the calculation of the damage diagnosis manual injection Yamaha motorcycle using Certainty Factor.

[KG04]	The road feels stilted.	MB [0,8]	MD [0:04]
[KG07]	Wasteful fuel consumption.	MB [0,2]	MD [0:02]
[KG10]	When the engine suddenly died.	MB [0,8]	MD [0:02]
[KG13]	The machine is turned difficult.	MB [0,7]	MD [0:04]
[KG21]	Engine running at idle is not stable.	MB [0,9]	MD [0:00]
[KG26]	Engine oil quickly reduced.	MB [0,2]	MD [0:00]

MB combination value based on the above calculation for each symptom "Dirty Injection" as above is as follows:

$$CF [HE] + 1,2B = MB1 (MB2 * (1 - MB1))$$

$$CF [HE] + 1,2B = 0.8 + (0.2 * (1-0,8))$$

$$CF [HE] + 1,2B = 0.8 + 0.04$$

$$CF [HE] + 1,2B = 0.84 \text{ old1}$$

$$CF [HE] \text{ old1},3B = MB \text{ old1} + (MB3 * (1 - MB \text{ old1}))$$

$CF [HE] \text{ old1,3B} = 0.84 + (0.8 * (1 - 0.84))$
 $CF [HE] \text{ old1,3B} = 0.84 + 0.128$
 $CF [HE] \text{ old1,3B} = 0.968 \text{ old2}$
 $CF [HE] \text{ old2,4B} = MB \text{ old2} + (MB4 * (1 - MB \text{ old2}))$
 $CF [HE] \text{ old2,4B} = 0,968 + (0.7 * (1 - 0,968))$
 $CF [HE] \text{ old2,4B} = 0,968 + 0.0224$
 $CF [HE] \text{ old2,4B} = 0.9904 \text{ old3}$
 $CF [HE] \text{ old3,5B} = MB \text{ old3} + (MB5 * (1 - MB \text{ old3}))$
 $CF [HE] \text{ old3,5B} = 0,9904 + (0.9 * (1 - 0,9904))$
 $CF [HE] \text{ old3,5B} = 0,9904 + 0.00864$
 $CF [HE] \text{ old3,5B} = 0.99904 \text{ old4}$
 $CF [HE] \text{ old4,6B} = MB \text{ old4} + (mb6 * (1 - MB \text{ old4}))$
 $CF [HE] \text{ old4,6B} = 0,99904 + (0.2 * (1 - 0,99904))$
 $CF [HE] \text{ old4,6B} = 0,99904 + 0.000192$
 $CF [HE] \text{ old4,6B} = 0.999232 \text{ old5}$

The combination of MD value based on the above calculation for each symptom "Dirty Injection" as above is as follows:

$CF [HE] \text{ 1,2D} = MD1 + (MD2 * (1 - MD1))$
 $CF [HE] \text{ 1,2D} = 0.04 + (0.02 * (1 - 0.04))$
 $CF [HE] \text{ 1,2D} = 0.04 + 0.0192$
 $CF [HE] \text{ 1,2D} = 0.0592 \text{ old1}$
 $CF [HE] \text{ old1,3D} = MD \text{ old1} + (MD3 * (1 - MD \text{ old1}))$
 $CF [HE] \text{ old1,3D} = 0,0592 + (0.02 * (1 - 0,0592))$
 $CF [HE] \text{ old1,3D} = 0,0592 + 0.018816$
 $CF [HE] \text{ old1,3D} = 0.078016 \text{ old2}$
 $CF [HE] \text{ old2,4D} = MD \text{ old2} + (MD4 * (1 - MD \text{ old2}))$
 $CF [HE] \text{ old2,4D} = 0,078016 + (0.04 * (1 - 0,078016))$
 $CF [HE] \text{ old2,4D} = 0,078016 + 0.03687936$
 $CF [HE] \text{ old2,4D} = 0.11489536 \text{ old3}$
 $CF [HE] \text{ old3,5D} = MD \text{ old3} + (MD5 * (1 - MD \text{ old3}))$
 $CF [HE] \text{ old3,5D} = 0,11489536 + (0.00 * (1 - 0,11,489,536))$
 $CF [HE] \text{ old3,5D} = 0,11,489,536 + 0$
 $CF [HE] \text{ old3,5D} = 0,11,489,536 \text{ old4}$
 $CF [HE] \text{ old4,6D} = MD \text{ old4} + (MD6 * (1 - MD \text{ old4}))$
 $CF [HE] \text{ old4,6D} = 0,11489536 + (0.00 * (1 - 0,11,489,536))$
 $CF [HE] \text{ old4,6D} = 0,11,489,536 + 0$
 $CF [HE] \text{ old4,6D} = 0,11,489,536 \text{ old5}$

Having obtained the MB and MD values then can be searched value of CF damage "Dirty Injection" as the following calculation:

$CF = MB \text{ (Certainty)} - MD \text{ (Uncertainty)}$
 $= .999232 \text{ to } 0.11489536$
 $= 0.88433664 \text{ or } 88.43\%$

It can be concluded that the damage was detected is Injection Dirty with confidence percentage is 88.43%.

4.3 System planning

Designing the system to be built using modeling Unified Modeling Language (UML). Use case diagrams describe the interaction between the user and the system so that it can be understood more easily. Here is a use case diagram diagnosis expert system damage motorcycle injection.

Fig. 2. Use Case Diagram Expert system

5. Conclusion

From the analysis, design, and implementation of this expert system making it obtained the following conclusions:

- Expert systems using certainty factor method can be used as a guideline for the mechanic if you want to carry out repairs to the damage.
- With the expert system can enable customers to increase knowledge and understanding of the various types of damage, the symptoms of damage and handling damage to the motorcycle injection.
- The creation of an expert system application to detect damage to the motorcycle injection with Certainty Factor method is beneficial for mechanical because it can simplify and shorten the time to repair the damage.
- The diagnosis had done olehpengunjung or mechanic can be accessed again by entering an email stored in the database.
